

# Experiment results log.

---

## Planned order of scenarios

Scenarios	Parameters	Week
A1	N	March 23 - March 29
A2	B	March 30 - April 5
A3	Datasets	March 30 - April 5
B1	Chain Strength	April 6 - April 12
B2	Embedding	April 13 - April 19
B3	Shots	April 20 - April 26
B4	Annealing	April 27 - May 3

## Actual order of scenarios

Scenarios	Parameters	Week
<b>A1</b>	<b>N</b>	<b>March 23 - March 29</b>
B1	Chain Strength	March 30 - April 5
A2	B	March 30 - April 5
A3	Datasets	April 6 - April 12
B2	Embedding	April 13 - April 19
B3	Shots	April 20 - April 26
B4	Annealing	April 27 - May 3

## Sidenotes to research about

- Scenario A1 epsilon values appear to follow a linear trend:  $y = (x-8) * 0.0142227624 + 1$
- Find what is the maximum N value that is supported by dwave

## Scenario A1

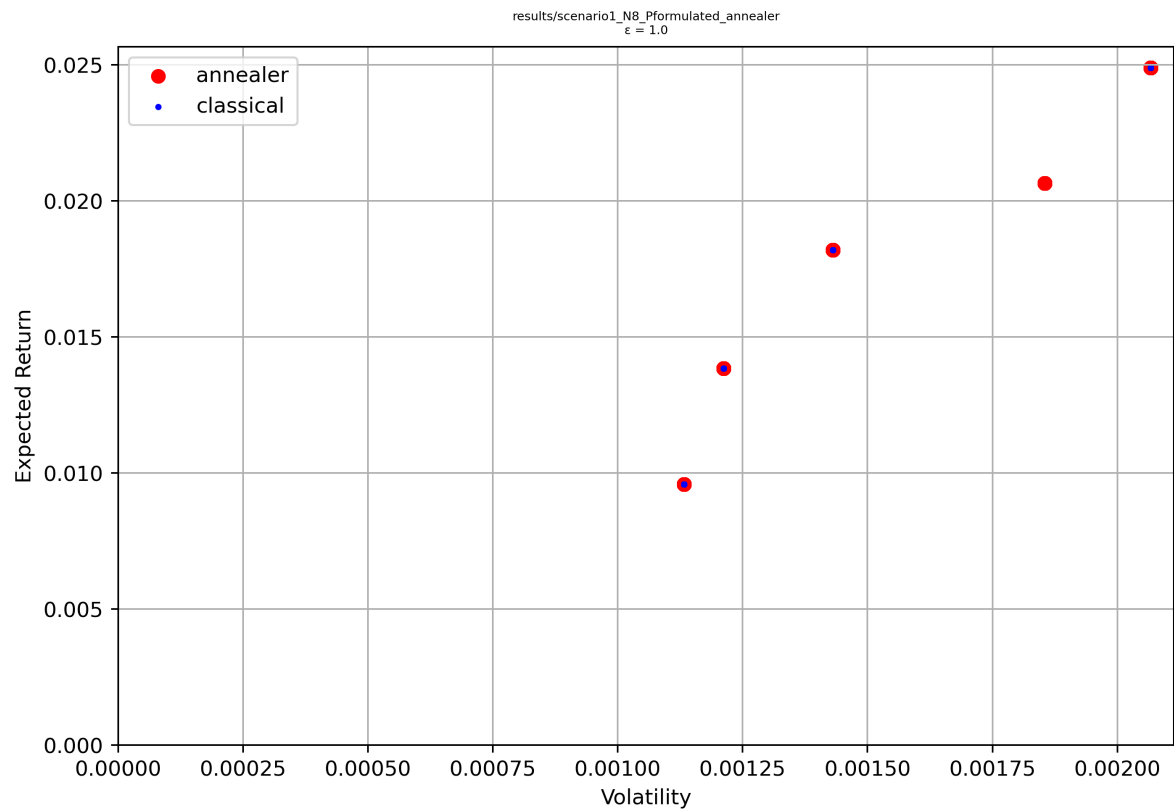

We started by experimenting several values of N, in order to find the maximum possible value of N that could be solved in a reasonable time by the classical solver.

The N values are: 8, 16, 32, and 64. P was calculated as  $P = -q * \text{min\_sigma} + \text{max\_mu}$

For this scenario, we used the "diversified" dataset and 1000 shots per execution. The q values are listed in the following table:

<b>N</b>	<b>q values</b>	<b>Epsilon Indicator</b>
8	0, 11, 20, 54	1.0
16	0, 2, 6, 100, 500	1.114
32	0, 0.4, 0.9, 2, 3, 9, 100	1.340
64	0, 0.2, 0.4, 0.6, 1.1, 1.3, 1.5, 2, 5, 6, 7, 8, 10, 100, 500	1.755

Epsilon Indicator - scenario1Y2021M03D31h18m52s49

Epsilon Indicator - scenario1Y2021M03D31h18m53s02

Epsilon Indicator - scenario1Y2021M03D31h18m53s15

Epsilon Indicator - scenario1Y2021M03D31h18m53s26

Key Takeaways:

As expected, the epsilon indicator increases with the **N** value. However, during those executions, dwave's problem inspector warned that the chains were too weak, and that, in the case of **N=64**, all samples had

broken chains. Based on this warning, we decided to immediately execute scenario B1, changing the original order of scenarios.

## Scenario B1

Looking at the fraction of chain breaks in Scenario A1, we know that on average each sample had almost a third (0.31) of its chains broken when  $N=32$ . This fraction increases to over half (0.54) when  $N=64$ ! Those values are very high and are another clue that the chain strength needs to be adjusted, especially for those values of  $N$ .

A good starting value for the chain strength is the maximum absolute value (maxAbs) of the QUBO matrix. However, this is not always the most optimal value. We need to test several values based on this initial value. By testing those values, we can find a value near the sweet spot between the probability that the chains are intact and the probability of finding optimal values. Refer to:

[https://www.dwavesys.com/sites/default/files/2\\_Wed\\_Am\\_PerfTips.pdf](https://www.dwavesys.com/sites/default/files/2_Wed_Am_PerfTips.pdf)

We have three tables, one for the epsilon indicator, one for the fractions of valid solutions, and one for the average fractions of chain breaks.

Starting with the average fractions of chain breaks (Lower is better):

Chain strength	N8	N16	N32	N64
default value	0.00081	0.01153	0.31350	0.54426
0.125 * maxAbs	0.00397	0.02741	0.31014	0.38301
0.250 * maxAbs	0.00034	0.00106	0.00170	0.00683
0.375 * maxAbs	0.00006	0.00032	0.00111	0.00453
0.500 * maxAbs	0.00006	0.00026	0.00149	0.00475
0.625 * maxAbs	0.00006	0.00031	0.00112	0.00453
0.750 * maxAbs	0.00006	0.00029	0.00130	0.00454
0.875 * maxAbs	0.00006	<b>0.00017</b>	0.00102	0.00461
1.000 * maxAbs	0.00003	0.00034	<b>0.00100</b>	0.00439
1.125 * maxAbs	<b>0.00000</b>	0.00030	0.00119	<b>0.00401</b>
1.250 * maxAbs	<b>0.00000</b>	0.00042	0.00125	0.00419
1.375 * maxAbs	0.00006	0.00028	0.00108	0.00424
1.500 * maxAbs	0.00009	0.00025	0.00201	0.00430

Next, we obtained the following fractions of valid solutions (Higher is better):

Chain strength	N8	N16	N32	N64
default value	0.877	<b>0.688</b>	0.121	0.094

Chain strength	N8	N16	N32	N64
0.125 * maxAbs	0.001	0.002	0.076	0.205
0.250 * maxAbs	<b>0.934</b>	0.622	<b>0.395</b>	<b>0.243</b>
0.375 * maxAbs	0.848	0.543	0.325	0.220
0.500 * maxAbs	0.781	0.485	0.299	0.186
0.625 * maxAbs	0.703	0.444	0.261	0.172
0.750 * maxAbs	0.665	0.388	0.252	0.170
0.875 * maxAbs	0.630	0.406	0.242	0.163
1.000 * maxAbs	0.598	0.366	0.235	0.151
1.125 * maxAbs	0.594	0.370	0.219	0.148
1.250 * maxAbs	0.556	0.342	0.223	0.129
1.375 * maxAbs	0.540	0.330	0.212	0.136
1.500 * maxAbs	0.512	0.310	0.198	0.138

Finally, we obtained the following epsilon indicators (Lower is better):

Chain strength	N8	N16	N32	N64
default value	<b>1.000</b>	<b>1.114</b>	1.340	1.755
0.125 * maxAbs	1.368	6.672	1.426	1.640
0.250 * maxAbs	<b>1.000</b>	1.167	<b>1.245</b>	1.504
0.375 * maxAbs	<b>1.000</b>	1.176*	1.275	1.429
0.500 * maxAbs	<b>1.000</b>	1.177	1.284	1.524
0.625 * maxAbs	<b>1.000</b>	1.208	1.325	<b>1.388</b>
0.750 * maxAbs	<b>1.000</b>	1.164	1.364	1.423
0.875 * maxAbs	<b>1.000</b>	1.208	1.372	1.358
1.000 * maxAbs	<b>1.000</b>	1.140	1.567	1.520
1.125 * maxAbs	<b>1.000</b>	1.182	1.350	1.421
1.250 * maxAbs	<b>1.000</b>	1.218	1.457	1.518
1.375 * maxAbs	<b>1.000</b>	1.130	1.462	1.488
1.500 * maxAbs	<b>1.000</b>	1.182	1.445	1.583

\* Interestingly, this iteration got 3 of the 5 optimal solutions.

Key Takeaways:

Looking at the results, we notice that the impact of any change to the chain strength is higher for higher values of  $N$ .

Next, for  $N=64$ , the sweet spot is near  $\text{chain\_strength} = 0.625 * \text{maxAbs}$ , despite the fact that this spot does not return neither the highest fraction of valid points or the lowest fraction of chain breaks.

Finally, for  $N=32$ , the sweet spot is near  $\text{chain\_strength} = 0.250 * \text{maxAbs}$ , despite the fact that this spot does not return the lowest fraction of chain breaks.

For the remaining values of  $N$ , no sweet spot can be accurately found. For the case  $N=16$ , the epsilon values are so similar that they fall under the margin of variation. For the case of  $N=8$ , every try gave a perfect score of 1.000.

There is an exception for both cases of  $N=8$  and  $N=16$ . When  $\text{chain\_strength} = 0.125 * \text{maxAbs}$  there is a high fraction of chain breaks and almost no samples are valid solutions. Thus, for this value of chain strength, the results are very bad.
